AdaBoost

1. Initialize $f(x) = 0, r = y$

2. For $b = 1,2,\dots,B$, repeat

   a) Fit a tree $f_b(x)$ to the training data (X, r)

   b) $f(x) \leftarrow f(x) + \lambda f_b(x)$

   c) $r \leftarrow r - \lambda f_b(x)$

3. output $\sum_{b=1}^{B} \lambda f_b(x)$

- AdaBoost

- Gradient Boost

- Classification

- Uses weights on data samples

- Each stump fits to y

- Predicts discrete values -1 or 1

- Uses exponential weight update

AdaBoost

1. Initialize sample weights $w_i = 1/N$

$$F(x) = \text{sign}[\ \sum_{b=1}^{B} \lambda_b\ f_b(x)\ ]$$

2. For $b = 1, 2, \dots, B$, repeat

   a) Fit a tree $f_b(x)$ to the training data (X, y) with sample weights w_i

   b) Calculate error $\varepsilon_b = \dfrac{\Sigma_{i=1}^{N} w_i I(y_i \neq f_b(x_i))}{\Sigma_{i=1}^{N} w_i}$

   (handwritten: 0, 1)

   c) Calculate model coefficient $\lambda_b = \frac{1}{2}\log(\dfrac{1-\varepsilon_b}{\varepsilon_b})$

   d) Update sample weights $\quad w_i \leftarrow w_i \exp\big(\lambda_b \cdot I(y_i \neq f_b)(x_i)\big)$

3. output $F(x) = \text{sign}[\ \sum_{b=1}^{B} \lambda_b\ f_b(x)\ ]$

AdaBoost

1. Initialize sample weights $w_i = 1/N$

	Age	Sex	ChestPain	Chol	AHD	weight

AdaBoost

class sklearn.ensemble.AdaBoostClassifier(*base_estimator=None*, *, *n_estimators=50*, *learning_rate=1.0*, *algorithm='SAMME.R'*, *random_state=None*)
Zhu, H. Zou, S. Rosset, T. Hastie, "Multi-class AdaBoost", 2009

https://scikit-learn.org/stable/auto_examples/ensemble/plot_adaboost_hastie_10_2.html#id4

Can AdaBoost also do Regression?

sklearn.ensemble.AdaBoostRegressor

```
class sklearn.ensemble.AdaBoostRegressor(base_estimator=None, *, n_estimators=50, learning_rate=1.0, loss='linear', random_state=None)                                                              [source]
```

How good is AdaBoost?

- Data: ~5k+ samples, ~20 features
